

Some tips for customizing emulation environment parameters

I recommend that you make minor changes to the configuration file dosbox-0.74-3.conf if you downloaded the original installation from dosbox.com.

Version of the configuration file included in the COAL Toolset is already adjusted. The only thing you might want to change is the window and font size, which is relatively large (to be clearly visible on the projector screen).

After installation of the original DOSBox version you can open this file using link to "DOSBox 0.74-3 Options" you'll find in Windows Start Menu. Before making any changes, I recommend to save the original version of this file (for example, with a different file name).

1. Find section [sdl] at the beginning of the configuration file and make sure fullscreen = false, because it is more convenient to work with the emulation environment in the window than in full screen mode. To adjust size of the emulator's window you may try several values of windowresolution, instead of windowresolution=original which often creates rather small window. Try for example windowresolution=1600x900 or windowresolution=1280x720 or other, and set output=overlay instead of default output=surface.
2. At the end of this configuration file is [autoexec] section that contains a script which is automatically executed when the emulation environment is started. You may add a script that makes it easier to access folders with your executable files you are going to run in this environment.
3. To suppress opening of the second window (i.e. Status Window) of the DOSBox application (which is a bit annoying) you may add option -noconsole to the command line which starts DOSBox. You'll find this in the Properties window (open it using right click on the DOSBox icon on your desktop) and carefully add -noconsole option in the Target field (for example, "C:\Program Files (x86)\DOSBox-0.74-3\DOSBox.exe" -noconsole -userconf).
